The condenser's job is to release heat, the heat the refrigerant absorbed while flowing through the evaporator. Refrigerant enters the condenser as a high-pressure vapor, but exits as a cooler, high-pressure liquid after flowing through the tubes and fins of the condenser.

COMPRESSORS

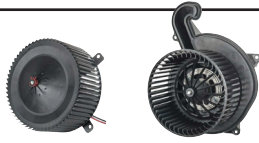

The compressor pumps refrigerant through the A/C system to produce comfortable, cool air. A faulty compressor would result in warm air circulating from the system, leaving you uncomfortable on long summer days.

EVAPORATORS

The evaporator uses the warm air in the cabin to vaporize the refrigerant by compressing liquid refrigerant and vaporizing it. That cold air is then pushed out through the vents.

APPLICATION	PART NUMBER	PRICE
Peterbilt	EVA2432	\$196.99ea
Volvo, Western Star	EVA1012	\$166.99ea
Mack	EVA2443	\$169.99ea

EXPANSION VALVES

The expansion valve controls the pressure in the A/C system by controlling the flow rate of liquid refrigerant, controlling the pressure drop, and controlling the output temperature of the refrigerant before moving to the evaporator.
